Dig the appropriate number of holes corresponding to your post quantities into the desired positions of the fence run. Holes should be dug approximately 300² x 800 deep in steps of either 3255 or 1725 depending on your panel sizes.

Figure 1

panel when they are in position to avoid splitting.

It is important to remember to install the Corner Posts in the correct position and decide on which side you

want to leave the gravel board (and panel) to post fixings showing.

Step Two: Installing Intermediate Gravel Boards

Figure 1. It may be advisable to pilot drill through the

Once all posts are set into their fixed positions, lay out the panels and gravel boards next to their intended positions to avoid any misplacements. When attaching the gravel boards, place one end between the post gap and fix into position using 1no. S/S M5 x 95Lg Security Torx Timber Screw through the post and gravel board as indicated in

holes of the posts when the gravel board is in position to avoid splitting. Avoid drilling completely through.

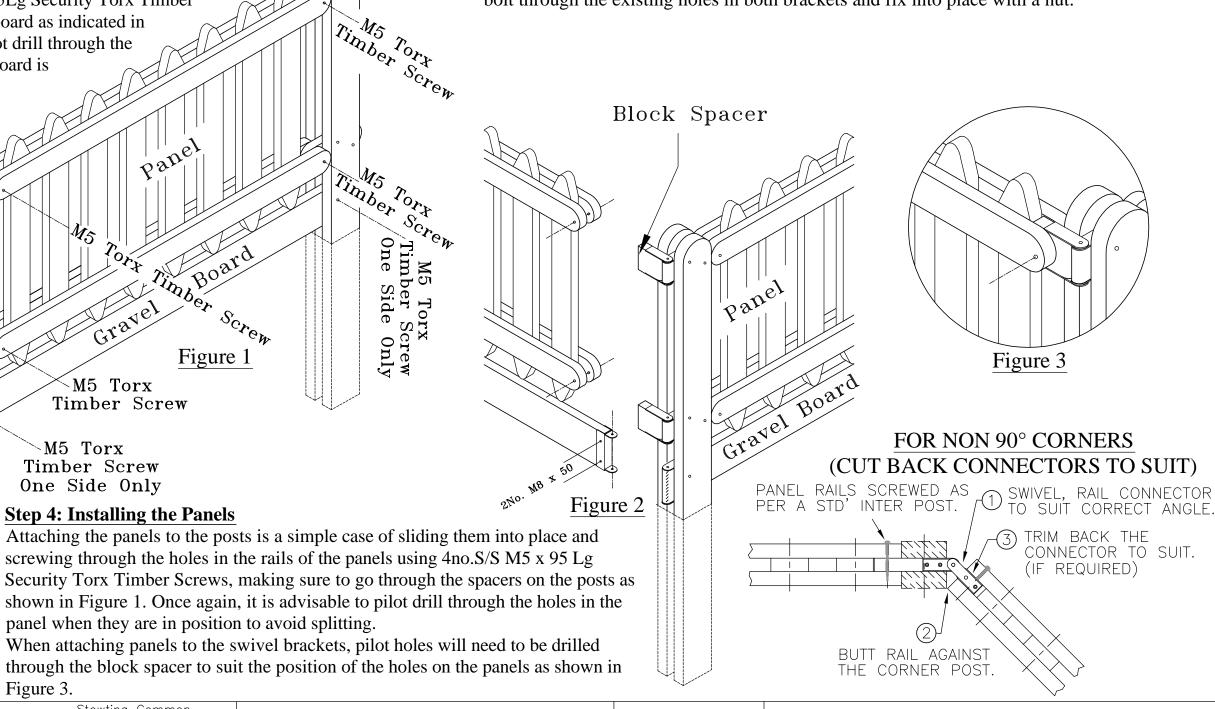

As illustrated in Figure 1, drill the LH board from 'this' side and the RH

board from the other.

Step 3: Installing Corner Gravel Boards

When installing a Gravel Board at a corner, the end of the gravel board needs to be cut flat so it will fit into the swivel bracket provided. The swivel bracket needs to be attached to the end of the gravel board needing to swivel, using 2no. M8 x 50 Bolts & Nuts

When the bracket is fixed to the gravel board attach it to the post bracket using 1no. M8 x 150 bolt through the existing holes in both brackets and fix into place with a nut.
